

History & Archive Workgroup Relational Database

The various component sub-groups within the workgroup have historically managed their own independent lists, catalogues and collections. The database sub-group is investigating the nature of the various datasets, how they inter-relate and how, in combining them, they can provide a more valuable research resource.

The product of this work is a web site that allows researchers to interrogate the database, provides new views of the information and will offer opportunities for all users to add to or edit the information.

The data tables can be grouped as:

- Library tables
- Biography tables
- Obituary Index tables
- Rolls of honour tables
- Peal Board tables
- Society tables
- Carter Ringing Machine tables
- Web Site lookup tables

The web site is at:

http://www.bellringinghistory.org.uk/

History & Archive Workgroup Relational Database

In the following pages, the tables relating to each area are coloured blue. Relationships to other areas are black & white.

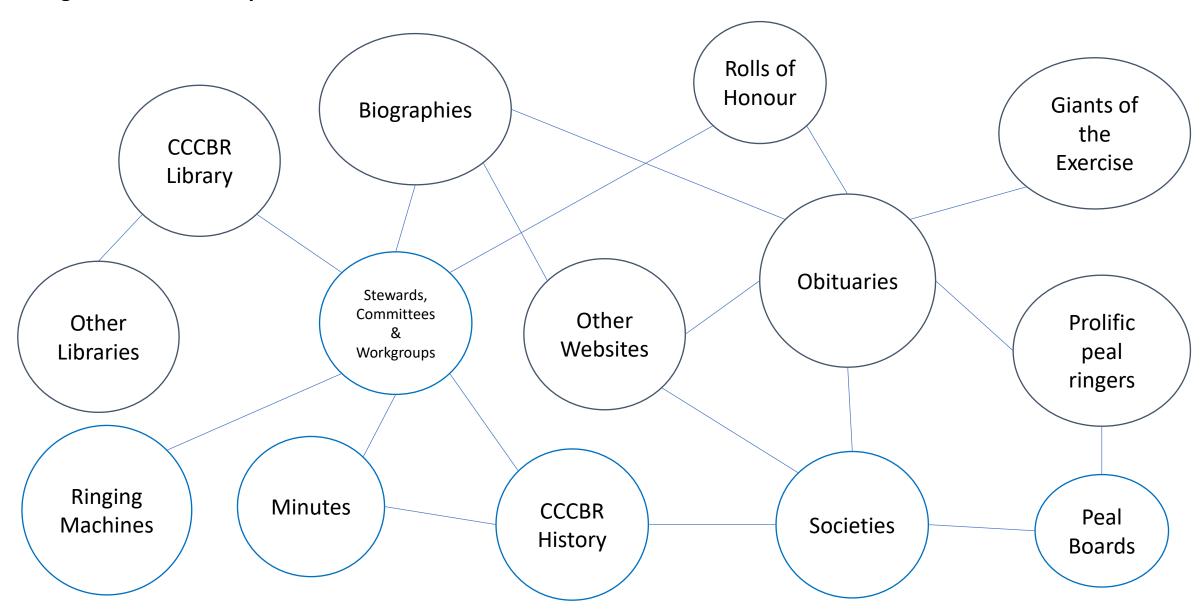

At the head of each table is the table name with the current number of rows in brackets.

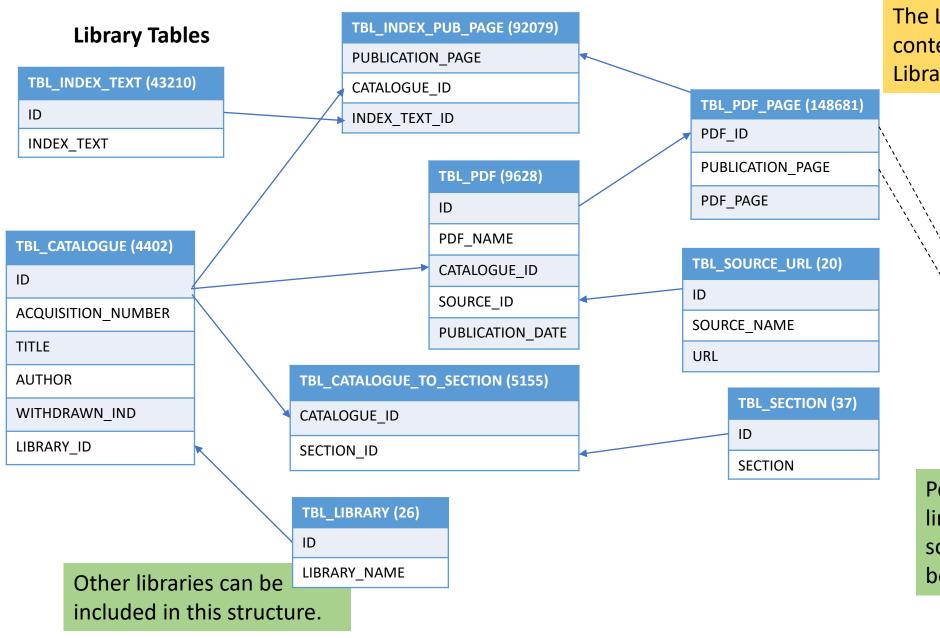

In a 'one to many' relationship, a reference table will have an ID column. Each value in that column is unique. This is the "one" side of the relationship. Other tables can be "linked" to that table if they have a column with a corresponding value. That is the "many" side of the relationship. The point of the arrow is at the "many" end of the line.

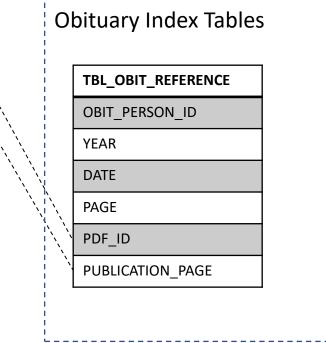

High level relationships

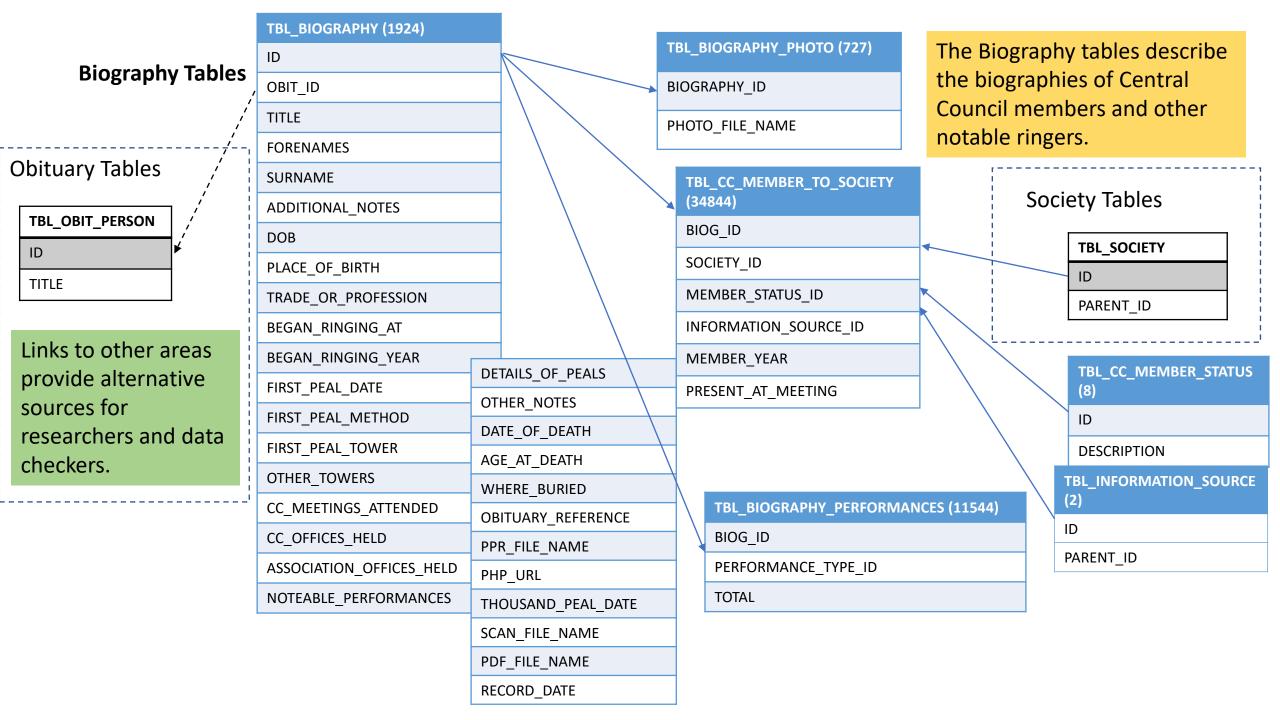

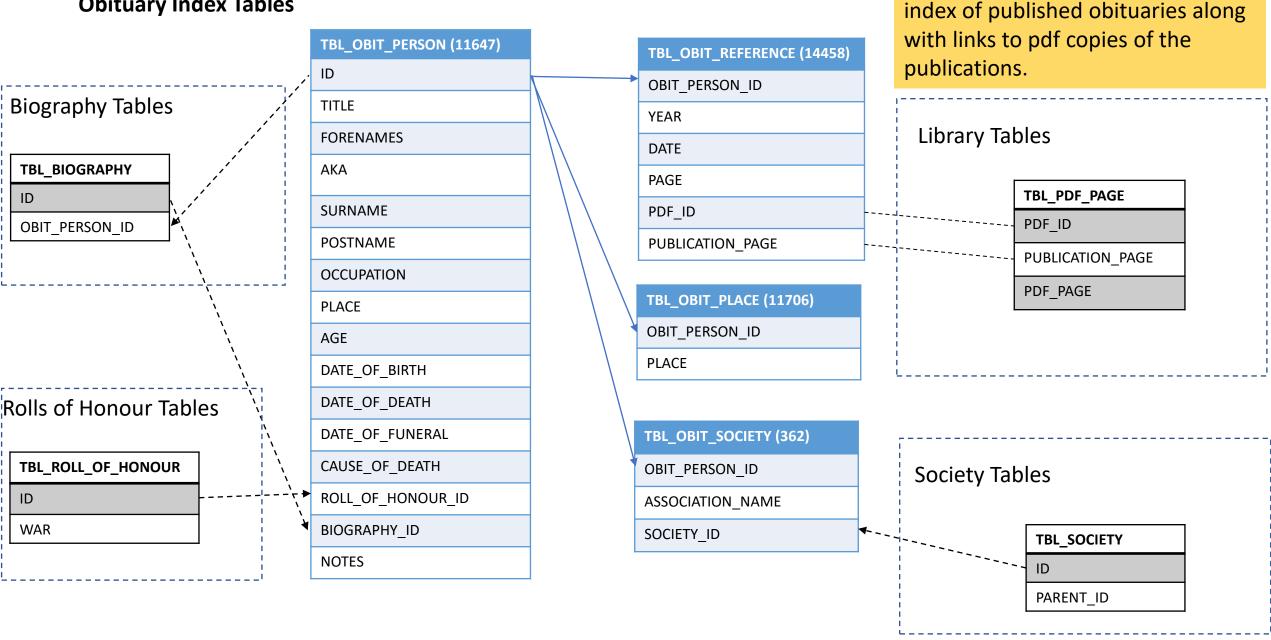

The Library tables describe the contents of the Central Council Library and associated resources.

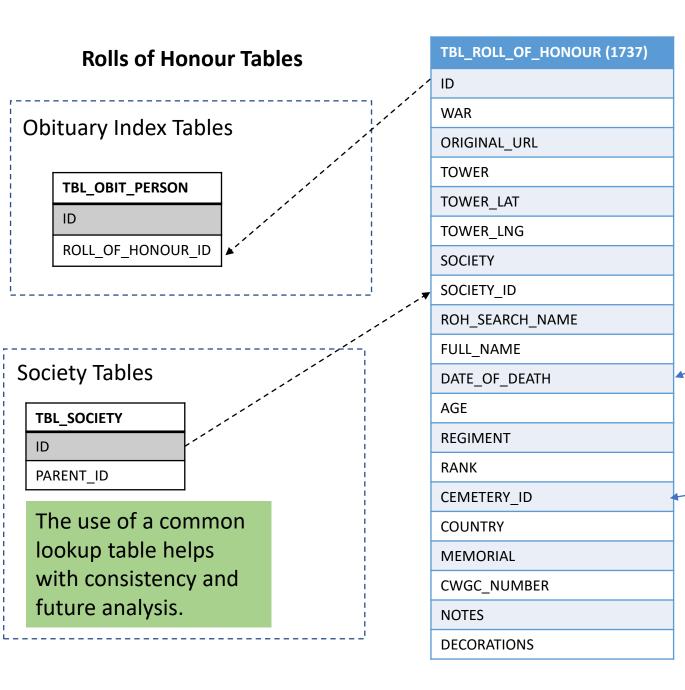

Pdf scans allow the website to link directly to articles within some publications. This works for both indexes and obituaries.

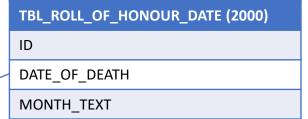

Obituary Index Tables

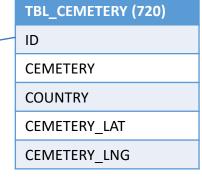

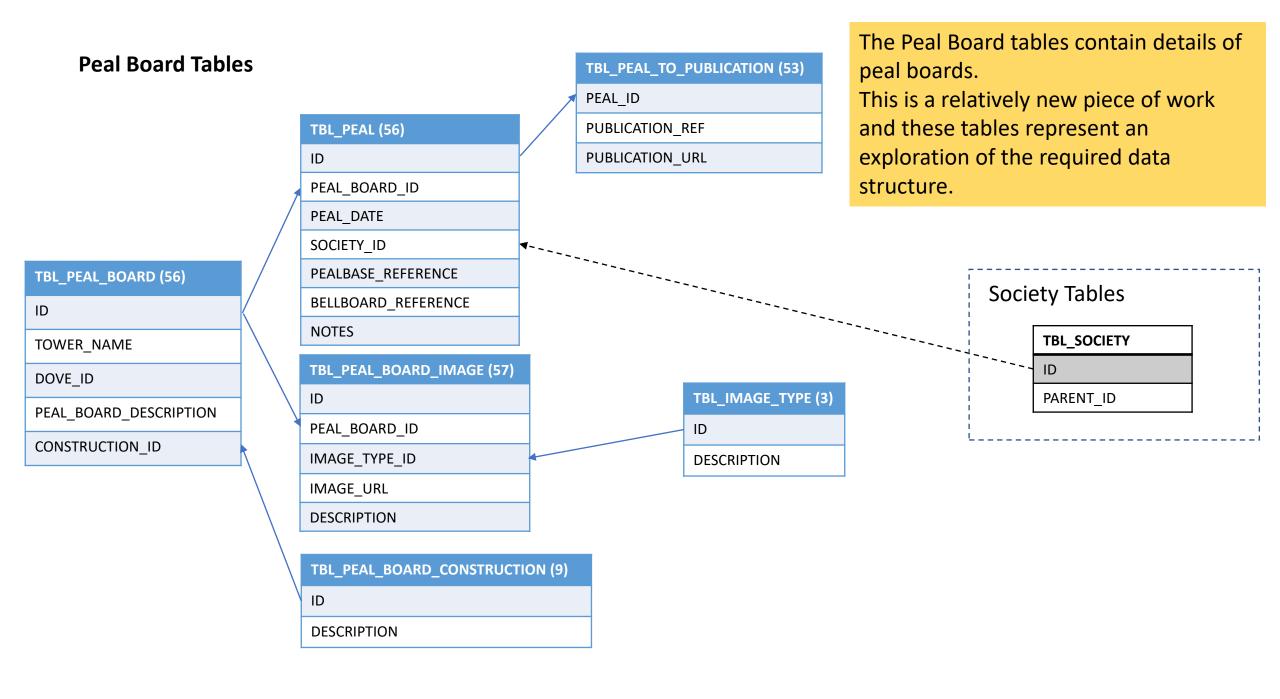

The Obituaries tables contain the

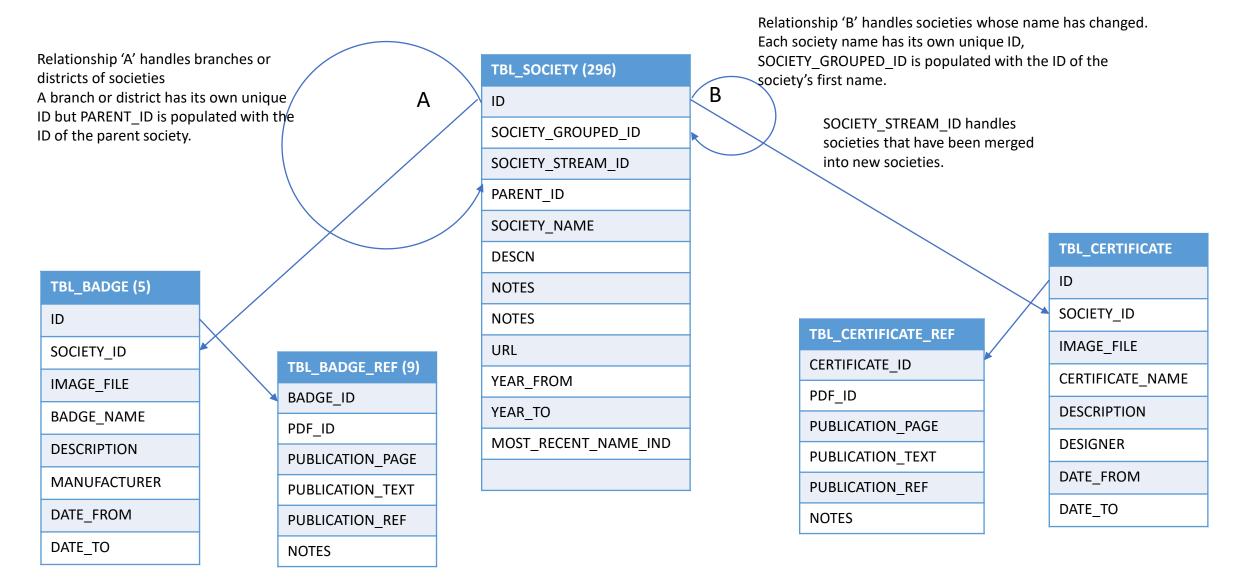

The Rolls of Honour tables contain details of ringers who have fallen in conflicts along with some associated detail such as coordinates for on-line mapping.

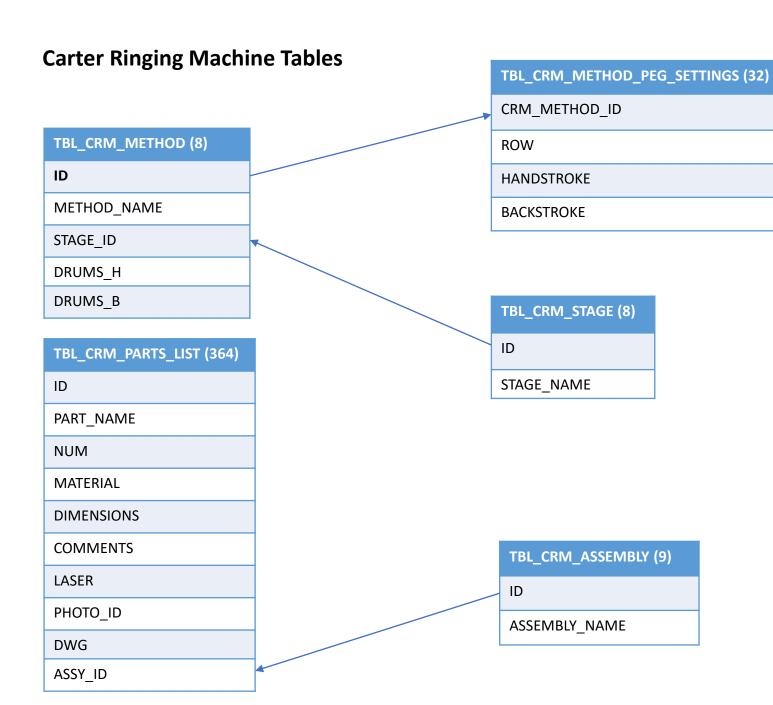

Society Tables

The Ringing Machine tables contain the parts catalogue and details of how to program the machine with different methods.

A coded facility to convert standard place notation to machine settings is planned rather than this limited lookup approach.

Other ringing machines could be included in this although it is likely that the different designs and structures will require different data structures.
